Reminders

- Midterm 1 during lecture time (Wed/Thur) in the lecture room
- Can bring one double-side **cheat sheet** with notes
- **No** outside resource (Google, ChatGPT, GitHub Copilot, Runestone...)

Deadlines

- Nothing due this Friday
- Project 1 due next Friday (10/13)

Newline Character

Practice Problem

- String methods:
 - `str.lower()`: converts all uppercase characters in a string into lowercase characters and returns it.
 - `str.upper()`: converts all lowercase characters in a string into uppercase characters and returns it.
 - `str.capitalize()`: converts the first character of a string to an uppercase letter and all other alphabets to lowercase.
 - `str.startswith(prefix)`: returns True if a string starts with the specified prefix. If not, it returns False
 - `str.find(sub_str)`: returns the index of first occurrence of the substring (if found). If not found, it returns -1.
- String indexing and slicing

Newline Character

Practice Problem

- List holds items in order
- List methods:
 - `list.append(item)`: adds an item to the end of the list.
 - `list.extend(list_2)`: adds all the elements of an iterable (list, tuple, string etc.) to the end of the list.
 - `list.pop(index)`: removes the item at the specified index. The method also returns the removed item.
 - `list.reverse()`: reverses the elements of the list.
 - `list.sort()`: sorts the items of a list in ascending or descending order.
- List indexing and slicing

List

Assume:

```
list_1 = ['a', 'b', 'c']
```

```
list_2 = ['d', 'e']
```

List

```
1 list_1.append('d')           # ['a', 'b', 'c', 'd']
2 list_1.extend(list_2)        # ['a', 'b', 'c', 'd', 'e']
3 list_1.pop(1)                # ['a', 'c']
4 list_1.reverse()             # ['c', 'b', 'a']
5 list_1.sort(reverse=True)    # ['c', 'b', 'a']
6 list_1[-1]                   # 'c'
7 list_1[1:]                    # ['b', 'c']
```

CSV format
Newline Character

Practice
Problem

- **For** loop
 - For each item in a collection:
 - `for element in list:`
 - `for key in dict:`
 - `for key in dict.keys():`
 - `for value in dict.values():`
 - `for key, value in dict.items():`
 - For value in range:
 - `for i in range(len(my_list)):`
- **While** loop: only executes while the Boolean expression is true

Tuple

- Immutable (unchangeable)
- Tuple indexing (the same as what we do for List)
- Unpacking a Tuple

Tuple

```
1 my_tuple = (1, 2, 3)
2 my_tuple[1] = 4      # thorw an error
3 my_tuple[1]          # return 2
4
5 a, b, c = my_tuple   # unpack a tuple
6 print(a)             # 1
7 print(b)             # 2
8 print(c)             # 3
```

Dictionary

- Key: Value pairs

Dictionary

```
1 my_dict = {'a': 1, 'b': 2, 'c': 3}
2 my_dict['d'] = 4      # create a new key-value pair
3 my_dict.get('c')      # return 3
4 my_dict.get('e', 0)   # return 0
5
6 # print key-value pairs in loop
7 for key, value in my_dict.items():
8     print(key, value)
```

Turtle

- Turtle methods
 - `forward(distance)`
 - `backward(distance)`
 - `color(str)`
 - `goto(x, y)`
 - `left(degree)`
 - `right(degree)`
 - `pendown()`
 - `penup()`
 - `setheading((degree))`
- Screen methods
 - `screensize(number)`
 - `bgcolor(str)`
 - `exitonclick()`

Class and Object

Unit Test

Working with CSV files

CSV format

Newline Character

Practice Problem

- **Class**: defines what all objects of the class know (attributes) and can do (methods)
- **Attribute**: Variable which is defined inside a class
 - **class attribute**: the variable defined in the class but outside the methods.
 - **object attribute**: the variable defined with self. (usually inside `__init__()`)
- **Object**: an instance of a class
- **Inheritance**: "is a type of" (dog is a type of animal)
- **Association**: "has a" (animal has a name)

Class and Object

Class and Object

```
1  class MyClass:
2      a = 'This is a class attribute' # This is a class attribute
3
4      def __init__(self, b):
5          self.b = b # This is an object attribute
6
7      def my_method(self, c):
8          # attributes can be accessed inside the class with 'self' keyword
9          print(self.a)
10         print(self.b)
11         # parameters can only be accessed inside this method
12         print(c)
```

Unit Test

Unit Test

```
1  import unittest
2
3  class TestAll(unittest.TestCase): # make a subclass of unittest.TestCase
4      def setUp(self): # setUp() will be executed before test cases
5          self.my_variable = 'some values'
6
7      def test_my_function(self):    # start each method with "test_"
8          self.assertEqual(my_function(), "expected output")
9          self.assertAlmostEqual(my_function(), 0.02 , places=2)
10         self.assertTrue(my_function())
11         self.assertFalse(my_function())
12
13  unittest.main() # run all tests
```

Working with CSV files

CSV format

Newline Character

Practice Problem

① Midterm Review

② Working with CSV files

③ Practice Problem

CSV Format

- CSV (Comma Separated Values) files are a simple and lightweight way to store structured data.
- CSV are a common format for sharing datasets.
- a CSV file represents data as a series of rows and columns, much like an Excel spreadsheet or a matrix.
- **Header row**: the first row of a CSV usually contains the name of each column. Most CSV files have one, but this is not required.
- Each line of a CSV represents a row. Usually the columns are separated from each other using commas " ," within each row.
- Other separators such as tabs " \t " and pipes " | " can be used, but commas are by far the most common.

CSV File Example

forestfires.csv

```
1 month,day,temp,RH,area
2 jul,tue,18.0,42,0.36
3 sep,tue,21.7,38,0.43
4 aug,wed,23.3,31,0.55
```

- Here the first line is header row
- Each row represents a set of data
- No need for additional spaces between commas.

Newline Characters \n

demo.txt

```
1  this is the first row
2  this is the second row
```

- When we open a CSV file in a program like Excel or an IDE like VSCode, the rows are automatically placed onto their own line for readability.
- However computers don't have eyes, so they need to use a special character called a newline to know where one line should end and one should begin.
- A newline character is represented in Python as `\n` and it counts as a single character: `len('\n') == 1` would return True
- The above file equals `"this is the first row\nthis is the second row"`

- 3 Practice Problem

Discussion 6 Exercise

- Go to Canvas → Assignment → Discussion 6 and clone the GitHub Repo
https://classroom.github.com/a/RH4n_meN
- We will be working with a dataset of Forest Fires

forestfires.csv

- **month**: month of the year: 'jan' to 'dec'
- **day**: day of the week: 'mon' to 'sun'
- **temp**: temperature in Celsius degrees: 2.2 to 33.30
- **RH**: relative humidity in
- **area**: the burned area of the forest (in hectares): 0.09 to 1090.84

Discussion 6 Exercise

Your task

- Our task is to read in the CSV file and builds a dictionary called `data_dict`
- Fix the bugs in the `build_data_dict()` method
- Implement all methods of the `FireReader` class
- Don't change test cases

```
1 self.data_dict = {  
2     'month': ['jul', 'sep', 'sep', ...],  
3     'day':   ['tue', 'tue', 'mon', ...],  
4     'temp':  [18.0, 21.7, 21.9, ...],  
5     'RH':    [42, 38, 39, ...],  
6     'area':  [0.36, 0.43, 0.47, ...]  
7 }
```
